ASSESSMENT TOOL - 2

CONCEPT MAPPING

① Concept Map 1:- cloud computing fundamentals include definitions, characteristics, benefits and limitations.

Ans

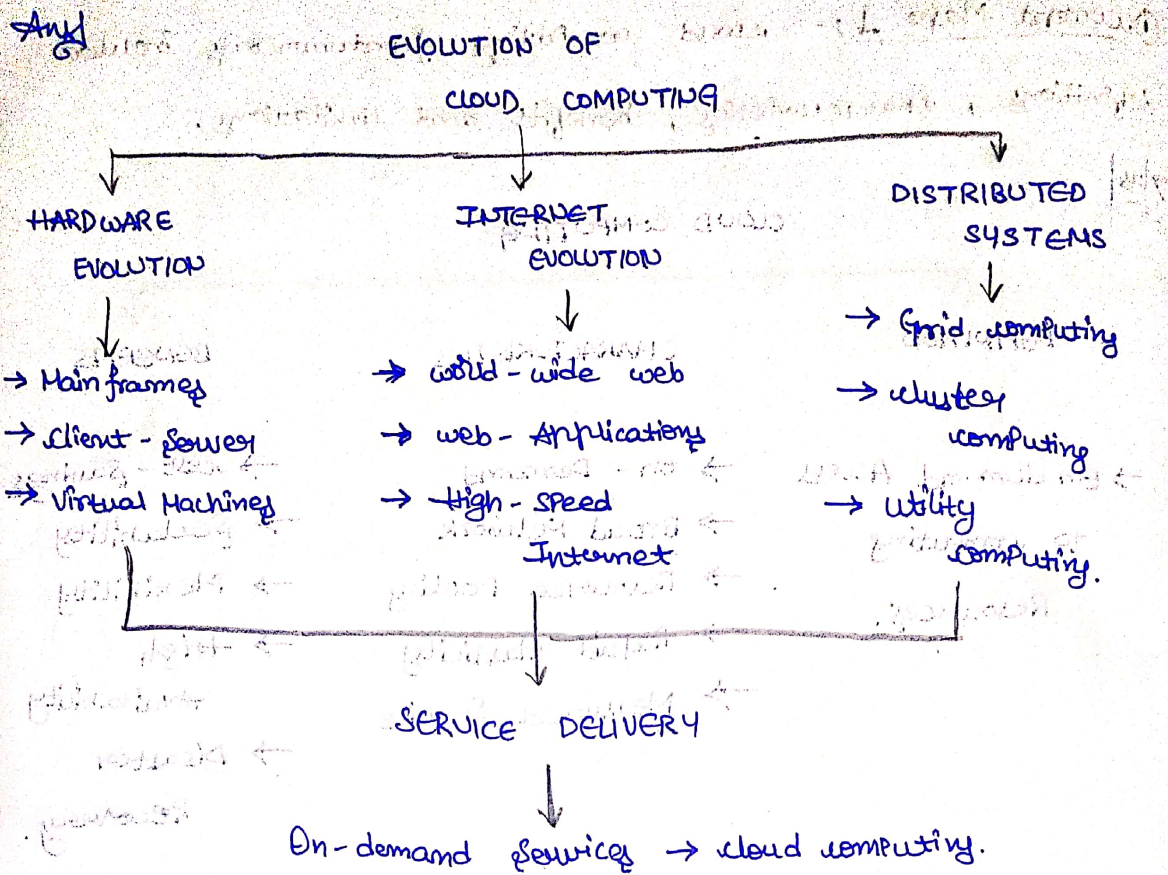

* cloud computing is the delivery of computing services such as servers, storage and software over the internet. It allows users to access resources anytime without owning the physical infrastructure.

* cloud resources can be accessed on demand without the human intervention from the service provider.

* users can scale resources up (or) down easily according to business requirements.

② concept Map 2 :- Evaluation of cloud computing. connect Hardware Evolution; Internet Software Evolution; distributed Systems, and service delivery.

* computing evolved from large main frame systems to the client - server Architecture and Virtual Machines.

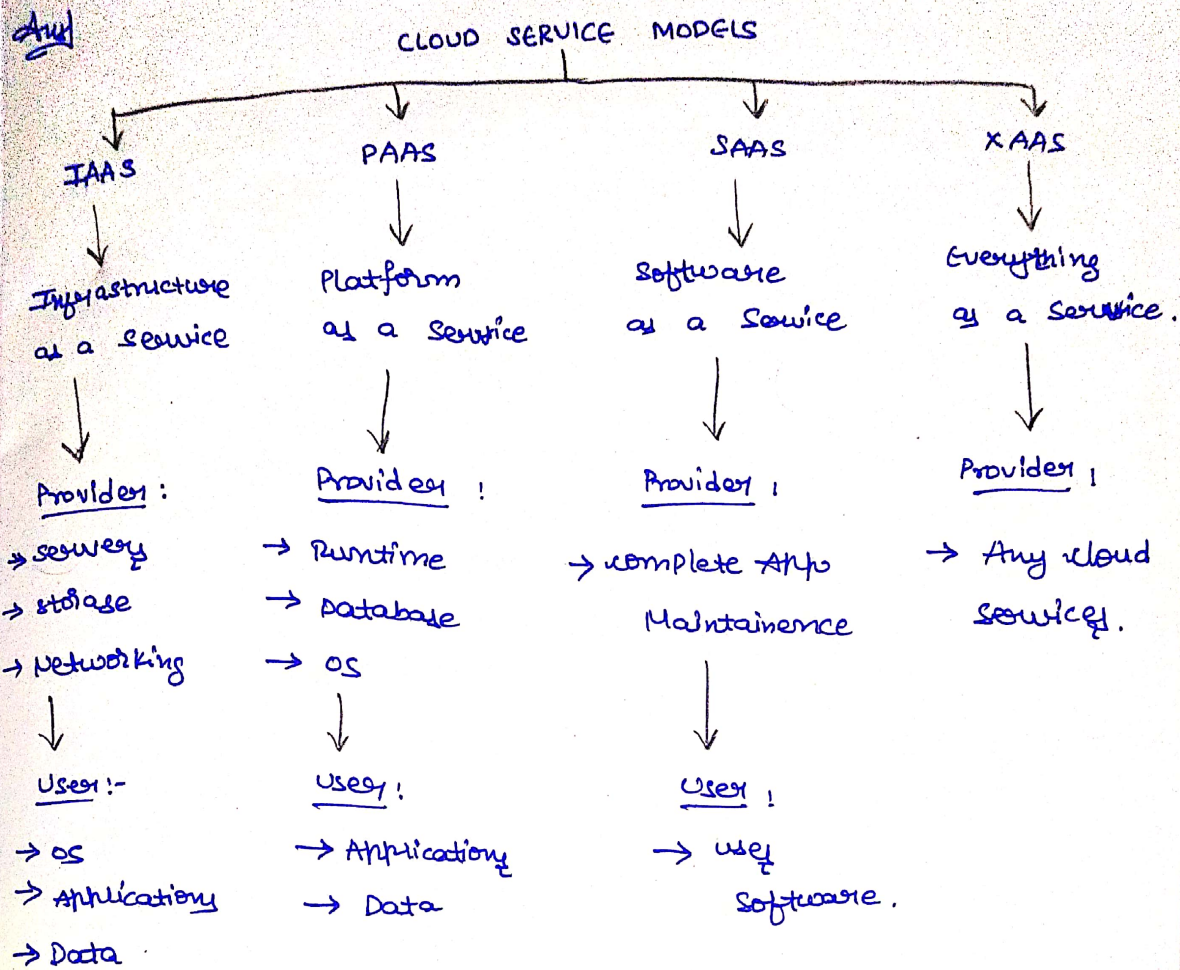

* Modern Hardware supports virtualization; making cloud computing efficient and Scalable.

* Faster Internet speeds and web technologies made cloud Based services widely available.

* Grid and cluster computing allowed multiple computers to work together on complex tasks.

* cloud services are delivered over the Internet when given the user needs them and user pay only for the services they consume, improving cost efficiency.

③ concept Map 3: Service Model. Map IaaS; PaaS; SaaS & XaaS with Provider Responsibilities and user Responsibilities &

* The Provider manages security; storage; Networking and the virtualization infrastructure.

* The Provider offers a complete Platform with Runtime Environment; database; and development tools.

* The Provider hosts and maintains the software while handling updates and security.

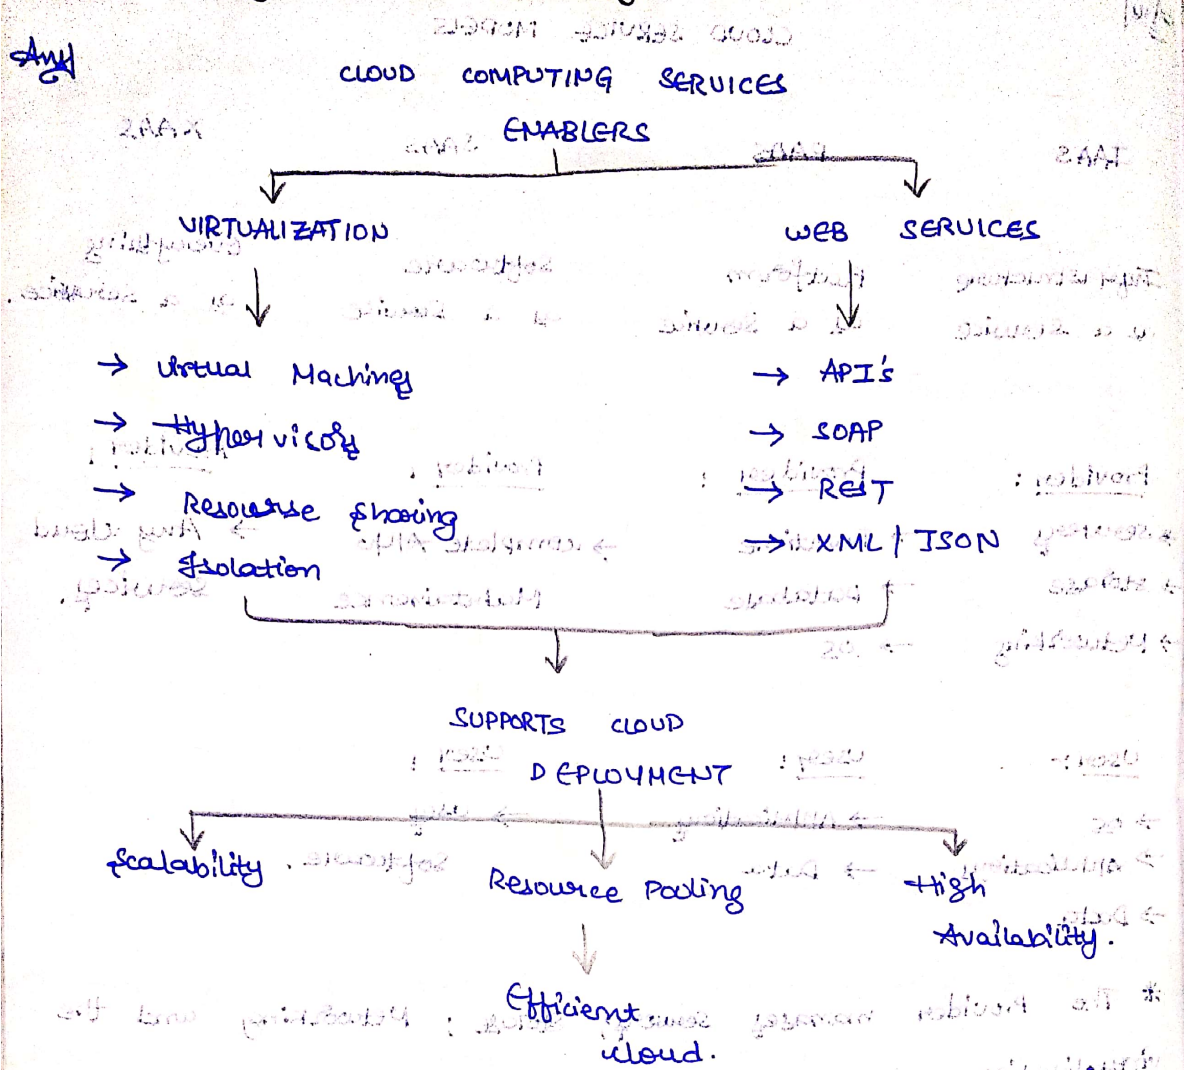

* XaaS includes all types of cloud services that are delivered through the internet.

* The user is responsible for installing the operating systems; Applications and managing the data with the

security

④ concept Map 4 :: Virtualization and web services are of Enablers of cloud. Show how these two concepts supports cloud deployment and scalability?

Ans)

* Virtualization creates multiple virtual machines on a single physical server to maximize Resource usage.

* web services Allow different Applications to communicate using Protocols like REST and SOAP.

* Virtualization and web services together enable Scalable and highly available cloud environments.

* They support efficient Resource sharing, Faster deployment and Reliable Application Performance.

* They Support Interoperability between systems Running on different Platforms.
